

□ Global Superstore Dataset

Data Analysis & Power BI Portfolio Project

Professional GitHub Portfolio Report

□ Project Overview

The Global Superstore Dataset is a fictional retail sales dataset used for Data Analysis, Business Intelligence, and Data Visualization. It contains customer orders across multiple countries and markets, making it ideal for analyzing sales trends, profitability, customer behavior, and overall business performance.

□ Objective

Analyze business performance and uncover actionable insights for data-driven decision-making.

□ Dataset Information

- Dataset: Global Superstore
- Domain: Retail & E-commerce
- Type: Transactional Sales Data
- Format: CSV / Excel
- Records: ~51,000+
- Features: 24-29 columns

□ Key Features

- Order ID
- Order Date & Ship Date
- Customer Name & Segment
- Product Category & Sub-Category
- Product Name
- Sales, Profit, Discount, Quantity
- Shipping Cost
- Region, Market, Country, State & City

□ Business Questions

- Which categories generate the highest sales?
- Which regions contribute the most profit?
- Does higher discount reduce profitability?
- Which customer segments generate the highest revenue?
- Which products are loss-making?
- How do sales and profit change over time?

□ Tools Used

- Power BI

□ Expected Outcomes

- Sales Performance Analysis
- Profitability Analysis
- Regional Performance Comparison
- Customer Segment Insights

- Discount Impact Analysis
- Product Category Performance
- Interactive Dashboard

□ Conclusion

This project demonstrates practical Data Analysis and dashboard-building skills using Power BI, helping showcase business insights in a professional GitHub portfolio.
